Proposal Presentation Guidelines

Team Project, Week 7

CSE 59358-01 3D Machine Intelligence, Fall 2026
Instructor: Jongmin Lee (jmlee@cau.ac.kr)

1. At a Glance

Table 1. Key facts for the proposal presentation.

Date	Thursday, October 15, 2026 (Week 7), in class, from 11:00
Teams	9 teams in 2 hours
Time per team	**10 minutes**: 8-minute talk in English + 2-minute Q&A
Q&A language	English or Korean
Video option	You may play a recorded 8-minute video of your slides instead of a live talk. Q&A is always live
Slide deadline	Submit your slides on e-Class **before 10:59 AM** on October 15
Weight	**15% of your final grade**

The proposal is a checkpoint, not a finished project. By Week 7 you must have a **running baseline with numbers**. A screenshot of a successful installation is not a baseline result.

2. What Your Proposal Must Show

A good proposal answers four things, and each one leads to the next (Figure 1).

1. **Problem.** Your task ID and name from the topic guide (for example, T02 Sparse-View 3D Reconstruction), the input and the output on one slide, the related work in brief, and why you chose this baseline. State its status label: public, conditional, or reduced re-implementation.
2. **Evidence.** The baseline results with at least **one metric under identical conditions**: the same data and the same metric as the paper or the method you compare with. Add **one failure case you actually observed**, not one you read about in the paper.
3. **Question. One** research question that comes out of that failure, stated with a hypothesis that can turn out false.
4. **Plan.** Which module you change, what you compare against, which controls you keep fixed, which ablations you run, and how this fits the weeks up to Week 15.

Also state **how to reproduce your baseline**: repository commit, checkpoint, data subset, and every change from the original setting (resolution, number of points or frames, iterations, evaluation scope). Report the run on one input with the GPU model, peak VRAM, and time.

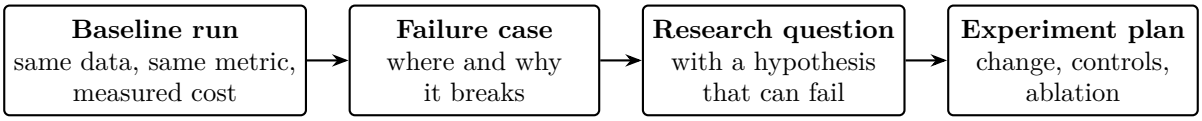

Figure 1. The storyline of a proposal. Each box is justified by the one on its left.

3. Suggested Slide Structure and Time Budget

Eight minutes is short. Plan for about **8 to 12 slides**. Table 2 is a suggestion, not a template you must follow, but every part of Section 2 must appear somewhere.

Table 2. A suggested 8-minute structure.

Slides	Part	Content	Time
1	Title	Team number, members, task ID and name	0:15
2	Problem	Input and output on one slide, why this task matters	1:00
3	Baseline	Why this baseline, setup, data subset, hardware	1:00
4–5	Evidence	Same-condition metric table, qualitative results, runtime and memory	1:45
6	Failure	One or two observed failure cases with a guess at the cause	1:15
7	Question	One research question and its hypothesis	0:45
8	Plan	What you change, controls, ablations, what result would support or reject the hypothesis	1:15
9	Schedule	Milestones up to Week 15, main risk and fallback	0:30
10	Summary	One slide the audience can remember	0:15
		Total	**8:00**

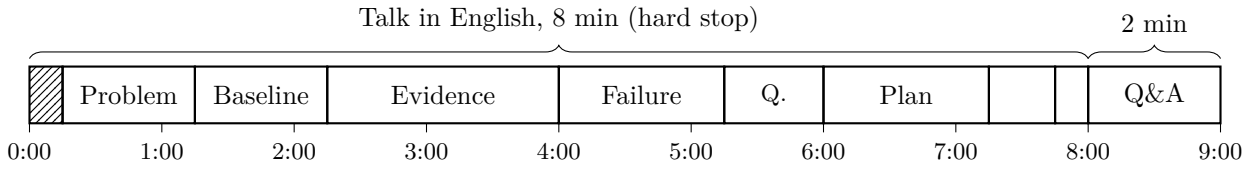

Figure 2. Time budget from Table 2. Evidence and failure take the largest share. Q. is the research question. The hatched cell is the title; the two narrow cells after the plan are the schedule and the summary.

Appendix slides

If you need more supporting material than fits in 8 minutes, **put it in appendix slides** after your last main slide, in the same file. Appendix slides are not presented in the talk, but they are used in three places:

- **Q&A**: open an appendix slide to answer a question.
- **Peer review**: other teams may read them when they review your proposal.
- **Instructor evaluation**: the instructor may read them when grading.

Good candidates are extra metric tables, more failure cases, the full experiment setup (commit, checkpoint, data subset, changes from the original), and related work. Mark them clearly, for example with an "Appendix" divider slide.

4. Live Talk or Recorded Video

Table 3. The two presentation options. Both use the same 10-minute slot.

	Live talk	**Recorded video**
Talk	8 minutes, in English, by one or more members	An 8-minute video of your slides with your voice, in English
Q&A	2 minutes, live	2 minutes, live, after the video
Submit	Slides on e-Class by 10:59 AM	Slides and the video on e-Class by 10:59 AM
Length	Stopped at 8:00	Videos longer than 8:00 are stopped at 8:00

- For a video, use MP4 (H.264), 1080p or 720p, and check that the audio is clear. Play it once from start to end before you submit.
- **Submit the video file on e-Class** together with your slides, by 10:59 AM.
- **Media check is mandatory.** If you present with a video, you **must** come early, before class starts, and play your video on the classroom computer to check the picture and the sound. **If the video does not play or has no sound during your slot, your presentation receives 0 points.**
- Whichever option you choose, **all team members attend** and anyone may be asked a question.

5. Submission

- **Deadline**: October 15, 2026, **10:59 AM** KST, on e-Class. This is one minute before class starts, so that all nine decks are ready before the first talk. A late deck is not accepted.
- One submission per team. Submit a **PDF** of your slides. You may add the original .pptx or .key file. Video teams also submit the video file on e-Class. Appendix slides go at the end of the same PDF.
- File name: `teamNN_TXX_proposal.pdf`, for example `team03_T13_proposal.pdf`. For a video, `teamNN_TXX_proposal.mp4`.
- We present from the submitted file. Changes made after 10:59 AM are not shown.

6. How the Proposal Is Evaluated (15% of the Final Grade)

We do not grade on state-of-the-art numbers. A clear question and an honest baseline count more than a large improvement you cannot explain.

Table 4. Evaluation criteria.

Criterion	**What a strong proposal shows**
Problem definition	Task, input, and output are precise. The reason for the choice is concrete
Baseline evidence	The baseline runs. At least one metric under identical conditions, with GPU, VRAM, and time
Failure analysis	A failure case observed by the team, with a plausible cause
Research question	One question that follows from the failure, with a hypothesis that can be rejected
Experiment plan	One change at a time, fixed controls, planned ablations, a realistic schedule to Week 15
Delivery and Q&A	Within 8 minutes, readable slides, clear answers from the team

7. Common Mistakes

- Spending half the talk on related work. One slide is enough, or none.
- Showing only the paper's figures. We want to see your runs.
- Three vague questions instead of one clear question.
- A plan that changes several things at once, so no result can be explained.
- Running out of time before the plan. Move optional material to the appendix slides.
